

Our aim: Calm the cough

The CALM-1 Study is looking at a potential new drug (an investigational drug) for the treatment of refractory chronic cough (RCC), including unexplained chronic cough. The aim of this study is to see how safe the investigational drug is and whether it works in people with RCC.

We plan to enroll a wide variety of participants because RCC and treatments may affect people differently based on their age, sex, gender, and race and/or ethnicity.

We are looking for adults who:

- are between 18 and 80 years of age
- have had a cough for at least 1 year that did not improve or only partially improved after medical evaluation and prescribed or over-the-counter treatments.
